

# PATENT

## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Docket No.: PT/DISALVO

In re Application of:	)	
Francesco DiSalvo et al.	)	
Appl. No.: 10/726,100	)	Examiner: Pete Vrettakos
Filed: December 2, 2003	)	Group Art Unit: 3739
For: SILVER ALLOYS FOR USE IN MEDICAL,	)	
SURGICAL AND MICROSURGICAL	)	
INSTRUMENTS AND PROCESS FOR	)	
PRODUCING THE ALLOYS	)	

### DECLARATION OF DR. JOSEPH NIAMTU III UNDER RULE 132

Joseph Niamtu hereby deposes and states:

1. I am a physician specializing in cosmetic facial surgery. I received my DMD degree from Case Western University in Cleveland, Ohio in May 1978. Internship and residency training from 1979 to 1983 I completed at the Charlotte Memorial Hospital (now Carolinas Medical Center) in Charlotte, North Carolina from 1978 to 1979 and thereafter at MCV in Richmond, Virginia, respectively. I am board certified by the American Board of Oral and Maxillofacial Surgery in oral and maxillofacial surgery and I am a fellow of both the American Academy of Cosmetic Surgery and the American Society for Lasers in Surgery and Medicine.

2. I am also teaching at one of four BOTOX® Cosmetic National Physician Training Centers located in Virginia where we train physicians in the method of application of BOTOX® for treating patients. I am also a member of the board of directors for The Cosmetic Foundation and serve as a teacher for the Lumenis Laser Company and for Ellman Radiofrequency Surgery, teaching physicians how to use lasers, respectively radiowaves in cosmetic surgical procedures.

3. I am currently in private practice in Richmond Virginia where I reside with my family. I am profoundly interested in developments in my field and lecture throughout the United States and internationally and to date have authored over 150 scientific articles and papers on a variety of topics in the field of cosmetic facial surgery, too numerous to list here in detail. To name a few: In 2000 and 2006 I served as editor of the textbook "Cosmetic Facial Surgery, Oral and Maxillofacial Clinics of North America" published by W. B. Saunders, Philadelphia. I contributed a textbook chapter "Essentials of Facelift Surgery" for the publication "Atlas of Cosmetic Surgery" which will be published by Elsevier in 2007. I also have lectured extensively on those topics. My publications and academic presentations are listed in Exhibit A.

4. As a volunteer, I am also treating third world children with facial deformities and recently received the Richmond Times-Dispatch Newspaper Community Service Award for my work in such charity organizations as Noah's Children, Operation Smile, Medical Care for Children, Richmond Area Retarded Citizens and the Safe Harbor Battered Women's shelter.

5. In my surgical practice I carry out all surgical procedures relating to the head and neck such as face lifts, brow lifts, neck lifts, laser treatments, eye lid surgery, ear surgery. I also carry out procedures such as lipo suction.

6. I make this declaration in support of U.S. Patent application No. 10/10/726,100 entitled "SILVER ALLOYS FOR USE IN MEDICAL, SURGICAL AND MICROSURGICAL INSTRUMENTS, AND PROCESS FOR PRODUCING THE ALLOYS" and covering inventions relating to an alloy and the use of the alloy for surgical instruments (the Patent Application) naming as inventors Mr. Francesco DiSalvo and Dr. Matteo Tutino and that I know to be currently pending in the United States Patent and Trademark Office. I am very familiar with the instruments made from the alloy covered by the invention.

5. One of the inventors, Dr. Tutino and I have a professional relationship. In the course of working with the Ellman Radiofrequency Surgery technique I have become closely familiar with the development of the alloy which is the subject of the Patent Application for use in surgical instruments. I originally used these electrodes which were supplied to me through Ellman International of Bayside New York a related company to the Ellman Radiofrequency Surgery company.

6. In the course of my surgical career as a cosmetic surgeon, I operate daily on a person's face. In this type surgery tissue scarring is one of the big problems. For example facial surgery not only requires very delicate operating techniques but one of the persistent problems is the danger of tissue damage which can occur during these delicate cosmetic surgical procedures. Our state of the art techniques

in this area of surgery have simplified procedures and shortened recovery time. Regardless of these new techniques, tissue damage can occur through the simplest of instrumentation used in cutting, excising or just holding biological tissue. In the course of conducting cutting sewing or such the use of suitable surgical hand instrumentation plays a vital role. Especially in cosmetic surgery, the scars from the surgical procedure are supposed to be invisible. The particular problem in this surgical field is to keep any type of interaction of the biological tissue and the hand instrumentation at the most neutral level. An example is in avoiding the generation of tissue resistance and thus heat generation which can cause tissue damage and scarring.

7. Surgeons in general are always aware of the danger that such tissue damage can be generated with hand instrumentation and electrodes and I am therefore always looking for new instruments that can be helpful in overcoming the problems of tissue trauma or damage and to avoid scarring.

8. In 2004, Dr. Tutino introduced me to a specific electrode made from an alloy he and his co-inventor had developed. The instrument, I was told, was made from an alloy unlike other alloys normally used for making surgical instruments such as for example forceps, electrodes, scalpels and such. Dr. Tutino explained to me that the special features of the surgical instruments made from this alloy were the fact that usage of these instruments reduced the scarring of biological tissue. It was explained to me that through the specific metal matrix present in the alloy, electron transfer was kept to a minimum and thus avoided an instrument that develops a high resistance and thus the generation of unacceptable heat.

9. Beginning in 2004, I started using an electrode made from this new alloy and was impressed with the excellent results in that tissue damage via thermal damage was markedly reduced.

10. I believe that the surgical instrument, especially an electrode made from the new alloy is a significant improvement over the standard electrodes used in surgery in that it is definitely improved and has superior performance in reducing tissue damage. I have been using the electrode now for about 24 months. The instrumentation using this new alloy fulfills a long felt need for improved performance and reduction in tissue damage from thermal currents. I also understand that since its introduction into the market, there has been a significant demand for the surgical instruments made from the alloy. This has been reflected in demand in the market place and sales.

11. I have perused the content of the Patent Application including the rejection by the Examiner based on an electrode for external use. I am specifically directing my statements to Patent No.: 4,375,219 to Schmidt the Examiner cited, which I refer to hereinafter as the "Schmidt" reference.

11. The following is my evaluation and my further substantive statements regarding the invention in view of the Schmidt reference. Schmidt discloses an electrode used for EKG measurement. EKG measurement is carried out on the surface of the skin. The electrode as shown and taught by the Schmidt reference clearly is an electrode for topical application only, namely for measuring heart activity. As a surgeon, I am surprised that the Examiner stated that the Patent

Office can take the position that such electrode is implantable. In my opinion, I can safely say that an electrode such as developed by Schmid would never be used for implantation into a body, nor is it the type of surgical electrode that would be used in surgical procedures. Thus, the electrode described by Schmid is not usable as a surgical electrode and as such does not represent a "surgical instrument". I also particularly noted that the alloy from which the Schmid electrode is made has a different composition; it has a much larger percentage of germanium than the alloy from which the surgical instruments which are the subject here are made. I am aware that the range of germanium content is critical to the favorable characteristics of the alloy for use in direct contact with biological muscle or brain tissue.

12. I am very much aware of the interaction of internal body tissue with a surgical instrument made from this new alloy. I have also noted superior surgical results in tissue interaction as compared to the conventional instruments. This result is due to the low resistance created in tissue interaction and also due to the emission of far infrared radiation. I know from my discussions with Dr. Tutino that the favorable characteristics of the surgical instruments are in part due to the particular content range of germanium as well as the application of a dopant in the metal alloy. In my long-term surgical experience no other surgical instruments were comparable in results to those that I have tried in surgery made from this alloy.

I declare under penalty of perjury under the laws of the United States of America  
that the foregoing is true and correct.

Date: 12/28/00
